# What is a Federated Search?

Federated search allows you to use search indexes which are created by other search engines outside of SharePoint. The results are then formatted and displayed on the same search results page as the SharePoint search results or in a separate web part. This feature was available in SharePoint 2010 but is now much simpler to configure through the use of Result Sources, the Query Builder and Search Query Rules.

1. Returned search results from Bing.
2. This indicates a Result Block.
3. SharePoint's search results.

The screenshot illustrates a SharePoint search results page for the query "SharePoint". On the left, there is a sidebar with various filters such as "Excel", "Newsfeed post", "Task", "Team Site", "Web page", "Word", and "Author". The main content area displays search results from Bing, with three numbered callouts: 1 points to the "Bing Results for 'SharePoint'" header, 2 points to a result block for "SharePoint Online – online collaboration software ...", and 3 points to a "Website" result. A "Microsoft SharePoint..." popup is visible on the right side of the page.

## Result Sources

Result sources tell SharePoint where to look for results and the results can also be filtered using specific criteria. They were formerly known as Search Scopes. An example of a search scope is Documents, Conversations or People. You can change the source at the farm, site collection or site level and you can also define your own result sources.

## Query Rules

Query Rules allow a site collection or site owner to add conditions so the results are dynamically reformulated to more closely match the intent of the search user. Search query rules can be aligned to one or more result sources to define the outcome of a search query. Each query rule has one or more conditions that must be met, actions that result when conditions are met, and publishing

options for when the query rule is active or inactive. One example for using a query rule would be when a user searches for 'sales figures,' a query rule could then alter the results so that the company's financial statements are displayed at the top of the results.

This white paper demonstrates the steps to take to set up a federated result source for a Bing search.

## Create the Result Source

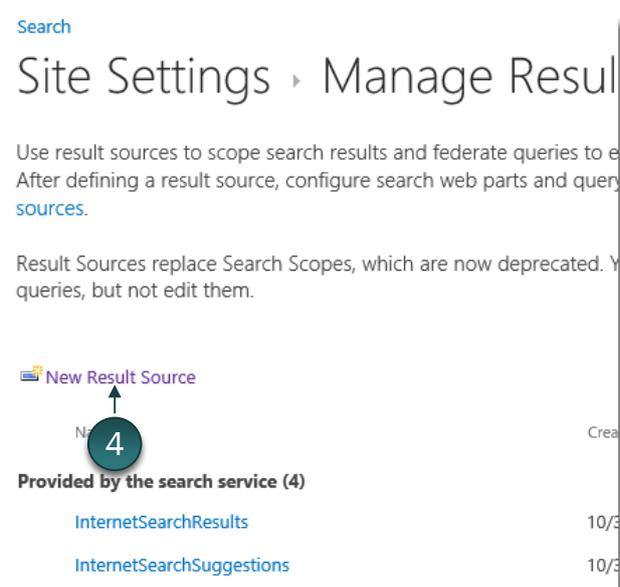

This must be done from the Search page of your site so you must first navigate there before completing the steps below, the URL may look something like this:

<https://CompanyName.sharepoint.com/search>

1. Click  to access the **Settings** menu.
2. Select **Site Settings**.
3. Under **Search** click on **Result Sources**.

4. At the top of the sources page click **New Result Source**.

5. Under **General Information** add a **Name** and **Description**.
6. Under **Protocol** select **Open Search 1.0/1.1**.

**General Information**

Names must be unique at each administrative level. For example, two result sources in a site cannot share a name, but one in a site and one provided by the site collection can.

Descriptions are shown as tooltips when selecting result sources in other configuration pages.

**Name**

**Description**

**Protocol**

Select Local SharePoint for results from the index of this Search Service.

Select OpenSearch 1.0/1.1 for results from a search engine that uses that protocol.

Local SharePoint  
 Remote SharePoint  
 OpenSearch 1.0/1.1  
 Exchange

7. Leave the **Query Transform** field as is.
8. In the **Source URL** field enter the following Bing URL:  
***http://www.bing.com/search?q={?searchterms}&format=rss&Market=en-US Credentials***.
9. Leave the **Credentials Information** set to **Anonymous**.

**Query Transform**

Change incoming queries to use this new query text instead. Include the incoming query in the new text by using the query variable "{searchTerms}".

Use this to scope results. For example, to only return OneNote items, set the new text to "{searchTerms} fileextension=one". Then, an incoming query "sharepoint" becomes "sharepoint fileextension=one". Launch the Query Builder for additional options.

[Launch Query Builder](#)  
[Learn more about query transforms.](#)

**Source Url**

Enter the URL of the OpenSearch source. Include the query in the URL by using the query variable "{searchTerms}", which will be automatically replaced with the query.

**Credentials Information**

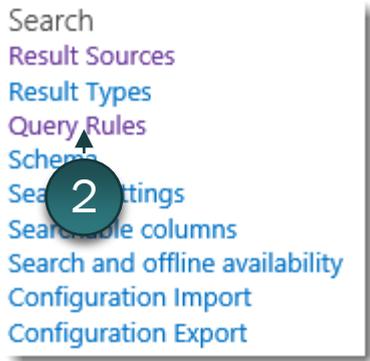

Select Default Authentication if users will connect to this source using the default SharePoint authentication.

Anonymous: This source does not require authentication  
 Common:

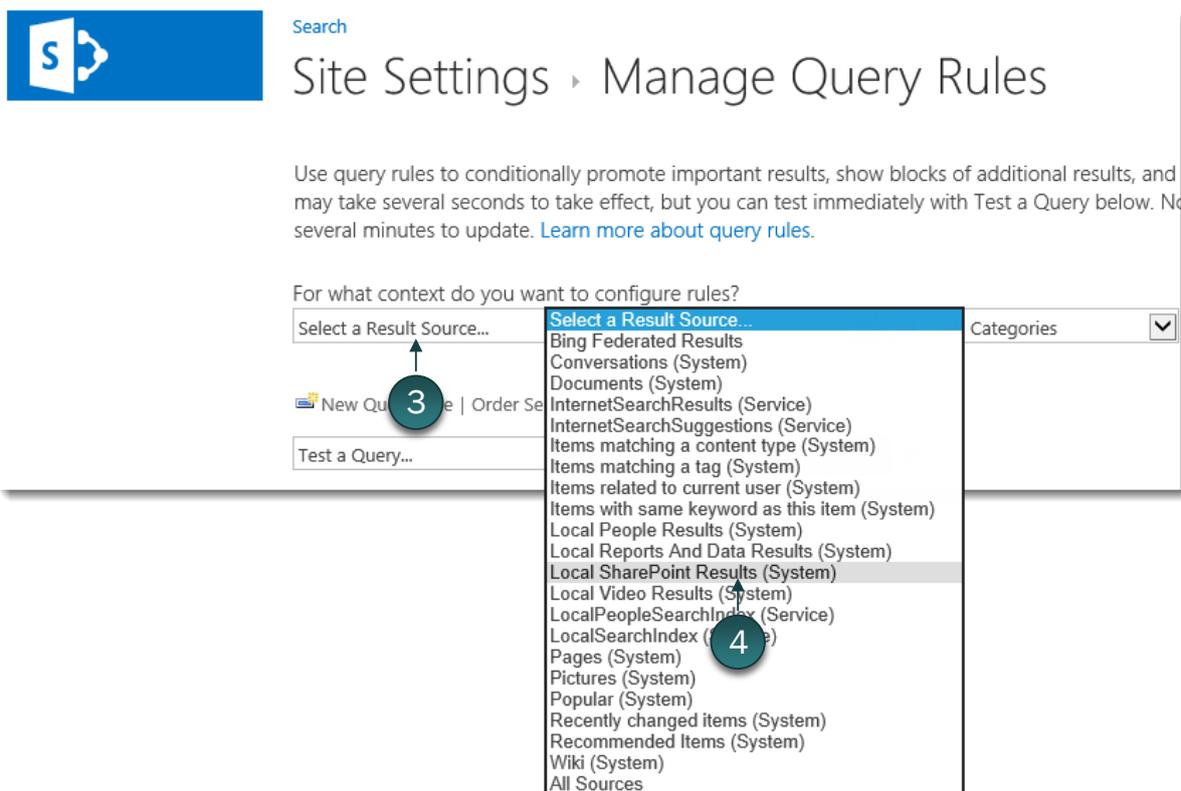

10. Scroll to the bottom of the page and click **Save**.

## Create the Query Rule

1. If necessary navigate to the search page of your site and click  to select **Site Settings** from the **Settings** menu.
2. Under **Search** click **Query Rules**.

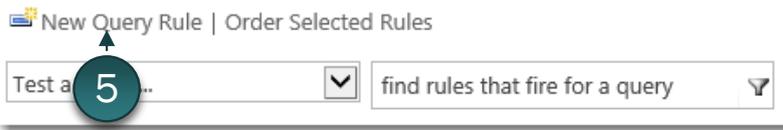

3. Click the drop down arrow next to **Select a Result Source**.
4. Select **Local SharePoint Results** from the menu.

This allows the query to return results from SharePoint as well.

5. Click **New Query Rule**.

6. Enter a **Rule name**.

7. Under **Query Conditions** click **Remove Condition**.

Search

## Site Settings › Add Query Rule

General Information

Rule name  
 ← **6** ×  
 Fires only on source Local SharePoint Results.

Context

Query Conditions

Define when a user's search box query makes this rule fire. You can specify multiple conditions of different types, or remove all conditions to fire for any query text. Every query condition becomes false if the query is not a simple keyword query, such as if it has quotes, property filters, parentheses, or special operators.

Query Matches Keyword Exactly ▼  
 Query **7** exactly matches one of these phrases (semi-colon separated)  
  
[Remove Condition](#)  
[Add Alternate Condition](#)

This means the query rule will fire on all searches.

## Create the Result Block

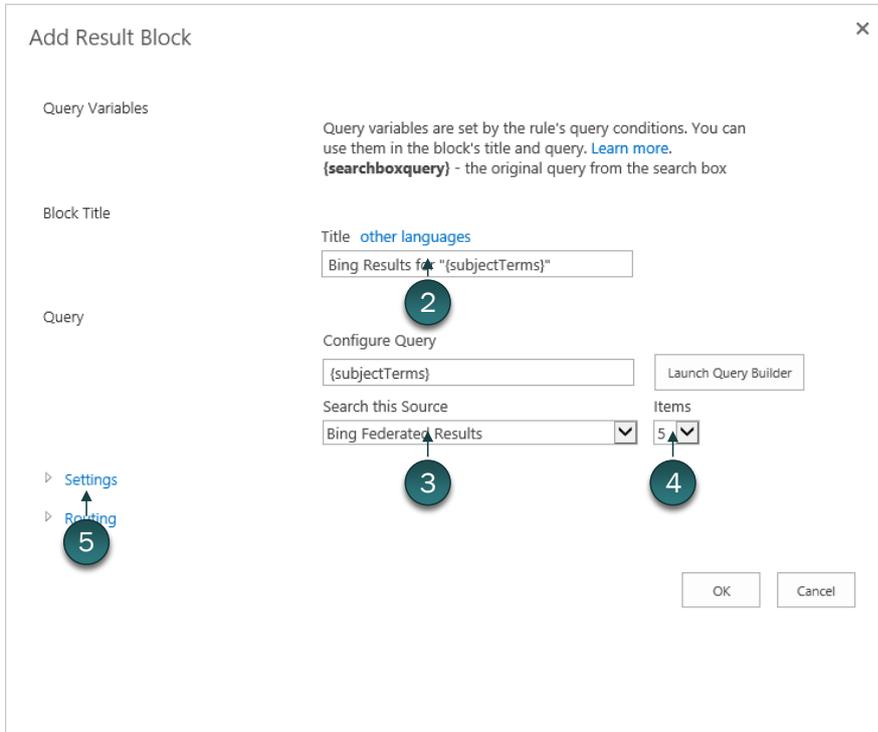

1. In the **Actions** area click on **Add a Result Block**.

Actions

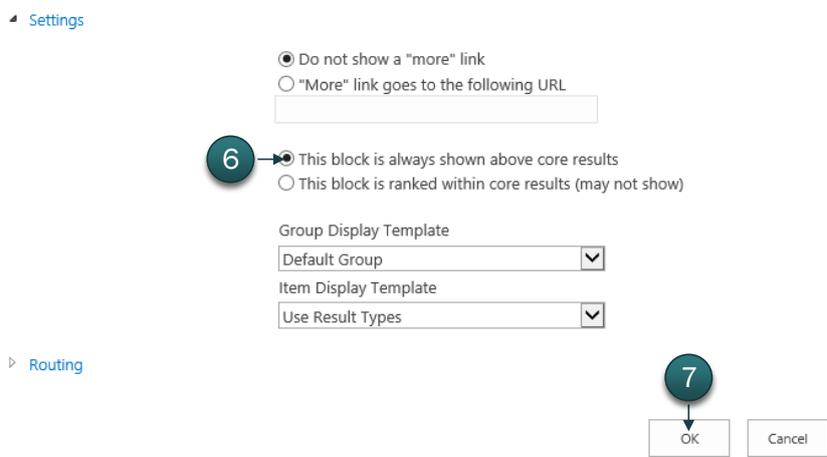

When your rule fires, it can enhance search results in three ways. It can add promoted results above the ranked results. It can also add blocks of additional results. Like normal results, these blocks can be promoted to always appear above ranked results or ranked so they only appear if highly relevant. Finally, the rule can change ranked results, such as tuning their ordering.

Promoted Results  
[Add Promoted Result](#)  
 Result Blocks  
[Add Result Block](#) **1**  
[Change ranked results by changing the query](#)

2. In the **Block Title** area change the title to something meaningful like *Bing Results for "{subjectTerms}"*.
3. Click the drop down menu under **Search this source** and select the result source you created earlier e.g. **Bing Federated Results**.
4. Change the **Items** drop down menu to the number of results you wish to display e.g. 5..
5. Expand **Settings**.

6. Select **This block is always shown above the core results**.
7. Click **OK** to complete.

This will display our block of Bing results above the SharePoint results, like a promoted result.

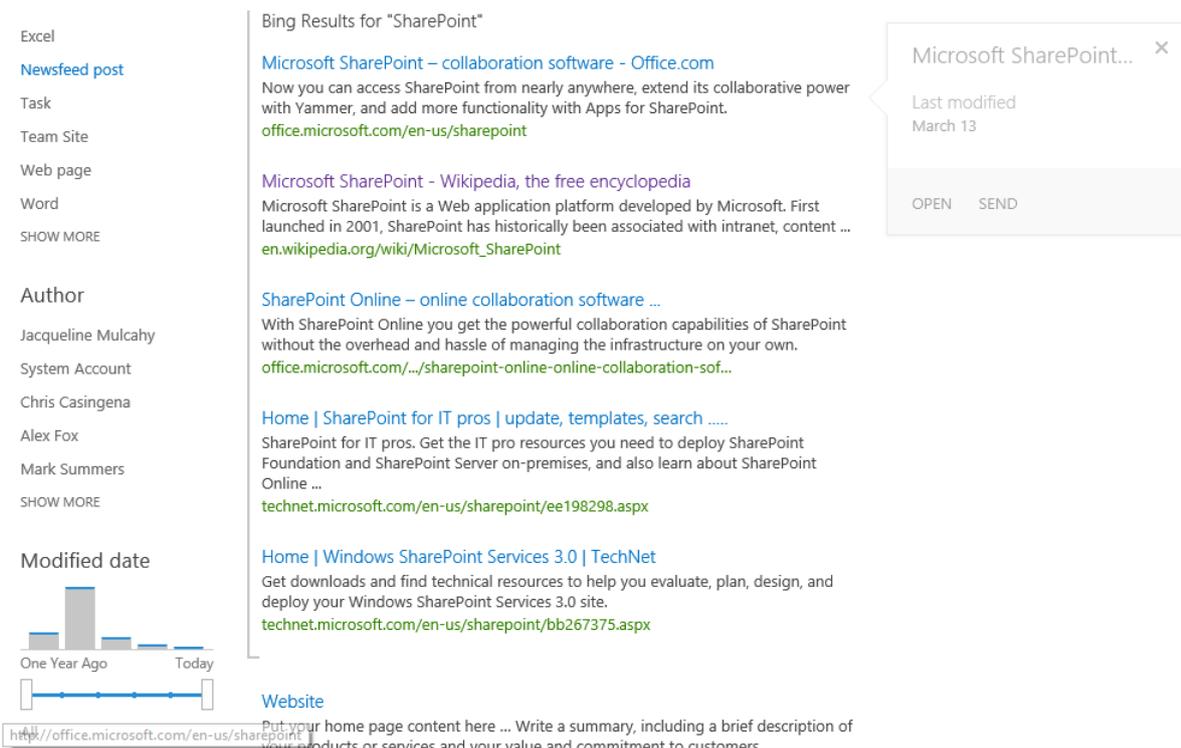

8. On the **Add Query Rule** page click **Save**.

9. Check your Query Rule is displayed under **Defined for this site**.

| Name  | Modified  | Conditions                                   | Actions   |
|---|-----------|--|---|
| <b>Defined for this site (3)</b>                      |           |  |   |
| <a href="#">Bing Results</a><br>Enterprise users only | 3/20/2014 | On Result Source<br>Local SharePoint Results | Add Promoted Result Blocks<br>Bing Results for "{subjectTerms}" |
| <a href="#">Reports and Data</a>                      |           | Advanced Query Text Match                    | Add Ranked Result Blocks  |

Test your new query and result source by carrying out a search the Bing Results are displayed above the SharePoint results and the Result Block is indicated with a square bracket to the left of the block.
